## Assignment of Oxidation Numbers Preliminary Guidelines

There are a number of rules guiding the assignment of oxidation numbers to elements, however, 95+% of the assignments may be made using the following basic rules.

1.) Elements in their standard states are assigned an oxidation number of 0

**Examples:**  $H_2 O_2 Pb S_8$  all have oxidation numbers of 0.

2.) Monatomic ions are assigned an oxidation number equal to the charge on the ion.

**Examples:** Na<sup>+</sup> Oxidation No. = +1, S<sup>-2</sup> Oxidation No. = -2 etc.

3.) Elements in Group I, Group II are usually assigned oxidation numbers equal to their common charge.

 $\begin{array}{l} \textbf{Examples: } NaClO_3 \ - Na \ is \ assigned \ an \ oxidation \ number \ of \ +1 \\ KMnO_4 - K \ is \ assigned \ an \ oxidation \ number \ of \ +1 \\ Mg(OH)_2 - Mg \ is \ assigned \ an \ oxidation \ number \ of \ +2 \\ CaC_2O_4 - Calcium \ is \ assigned \ an \ oxidation \ number \ of \ +2 \end{array}$ 

4.) Oxygen in **usually** assigned an oxidation number of -2 in a polyatomic molecule.

The exceptions are  $O_2$ , molecules of oxygen alone, such as ozone,  $O_3^{-1}$  and peroxides such as hydrogen peroxide,  $H_2O_2$ .

**Examples:** In SO<sub>2</sub>, KMnO<sub>4</sub> HNO<sub>3</sub>, **each** of the oxygens are assigned an oxidation number of -2.

This last one ties everything together in order to allow the assignment of more difficult elements.

- 5.) The sum of all the oxidation numbers of the elements in a molecule must be equal to the charge on the molecule.
- **Examples:** NaF From Rule 3.), Na is assigned an oxidation number of +1. The molecule is neutral, therefore, F must be assigned an oxidation number of -1.
  - $SO_3^{-2}$  From 4.) oxygen is assigned an oxidation number of -2. Since there are 3 oxygens, each with -2 and the charge on the molecule is -1, Sulfur must have an oxidation number of  $x + 3 \times (-2) = -2$  x = S == +4
  - KMnO<sub>4</sub> From 3.), K is assigned an oxidation number of +1 and from From 4.) oxygen is assigned an oxidation number of -2. Since there are 4 oxygens, each with -2 and the charge on the molecule is 0, Mn must have an oxidation number of  $(+1) + x + (4 \times (-2)) = 0$  or x = Mn = +7

## Redox Balancing Method BLB Method (OOHe)

Discussed in the lecture text by Brown and Lemay, this method, which I call the OOHe method (pronounced oooooweeeee!) stands for the order in which the items in the reaction are balanced. In order, the letters mean:

O = Other atoms O = Oxygen H = Hydrogen e = electrons

Consider the reaction:  $Cr_2O_7^{-2} + H_2C_2O_4 \rightarrow Cr^{+3} + CO_2$ 

**Step 1:** Assign oxidation numbers and break up the reaction into an oxidation half reaction and a reduction half reaction.

$$\begin{array}{rcl} \operatorname{Ox} \# & +6 & +3 \\ & \operatorname{Cr}_2 \operatorname{O}_7^{-2} & \rightarrow & \operatorname{Cr}^{+3} \end{array} & (reduction half reaction) \\ \\ \operatorname{Ox} \# & +3 & +4 \\ & \operatorname{H}_2 \operatorname{C}_2 \operatorname{O}_4 & \rightarrow & \operatorname{CO}_2 \end{array} & (oxidation half reaction) \end{array}$$

Step 2: Balance all the other atoms except for oxygen and hydrogen. ( $\underline{O}$  = Other atoms)

$$\operatorname{Cr}_2\operatorname{O_7}^{-2} \rightarrow \mathbf{2}\operatorname{Cr}^{+3}$$
  
 $\operatorname{H}_2\operatorname{C}_2\operatorname{O}_4 \rightarrow \mathbf{2}\operatorname{CO}_2$ 

Step 3: Balance oxygen atoms using water  $(\underline{O} = Oxygens)$ 

$$Cr_2O_7^{-2} \rightarrow 2 Cr^{+3} + 7 H_2O$$
  
 $H_2C_2O_4 \rightarrow 2 CO_2$  Note: Oxygen atoms are already balanced here.

Step 4: Balance the hydrogen atoms using  $H^+$  ions. (<u>H</u> = Hydrogens)

$$\mathbf{14} \, \mathbf{H}^{+} + \mathbf{Cr}_2 \mathbf{O}_7^{-2} \longrightarrow 2 \, \mathbf{Cr}^{+3} + 7 \, \mathbf{H}_2 \mathbf{O}$$

 $H_2C_2O_4 \quad \rightarrow \quad 2 \ CO_2 \ + \ \textbf{2} \ \textbf{H}^+$ 

**Step 5: Balance the charges electrons using water** (<u>e</u> = **Electrons**)

$$6 \mathbf{e}^{-} + 14 \mathbf{H}^{+} + \mathbf{Cr}_2 \mathbf{O}_7^{-2} \rightarrow 2 \mathbf{Cr}^{+3} + 7 \mathbf{H}_2 \mathbf{O}$$
$$\mathbf{H}_2 \mathbf{C}_2 \mathbf{O}_4 \rightarrow 2 \mathbf{CO}_2 + 2 \mathbf{H}^{+} + \mathbf{2} \mathbf{e}^{-}$$

# **Step 6: Recombine equations, multiplying as needed to eliminate the appearance of electrons on either side of the reaction.**

Multiply oxalate (H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>) equation by 3. Combining yields

$$14 \text{ H}^{+} + \text{Cr}_2 \text{O}_7^{-2} + 3 \text{ H}_2 \text{C}_2 \text{O}_4 \rightarrow 6 \text{ CO}_2 + 6 \text{ H}^{+} + 2 \text{ Cr}^{+3} + 7 \text{ H}_2 \text{O}$$

or canceling excess hydrogen ions and waters...

$$8 H^{+} + Cr_{2}O_{7}^{-2} + 3 H_{2}C_{2}O_{4} \rightarrow 6 CO_{2} + 2 Cr^{+3} + 7 H_{2}O_{7}^{-2} + 3 H_{2}C_{7}O_{7}^{-2} + 3 H_{2}O_{7}^{-2} + 3 H_{2}$$

#### Step 7 – If necessary for basic solutions.

For basic solutions, add OH<sup>-</sup>'s on both sides to neutralize **all** the acidic hydrogen ions, turning them into water. In this instance, I need to add 8 for the H<sup>+</sup> ions **and** 6 for the oxalic acid for a TOTAL of 14 OH<sup>-</sup>'s.

Executing, I get..

$$14 \text{ H}_2\text{O} + \text{Cr}_2\text{O}_7^{-2} + 3 \text{ C}_2\text{O}_4^{-2} \rightarrow 6 \text{ CO}_2 + 2 \text{ Cr}^{+3} + 7 \text{ H}_2\text{O} + 14 \text{ OH}^{-1}$$

Canceling the extra waters give the final result...

$$7 H_2O + Cr_2O_7^{-2} + 3 C_2O_4^{-2} \rightarrow 6 CO_2 + 2 Cr^{+3} + 14 OH^{-1}$$

### **Redox Balancing Method**

Consider the reaction:  $BiO_3^- + Mn^{+2} \rightarrow MnO_4^- + Bi^{+3}$ 

Step 1: Assign oxidation numbers and break up the reaction into a oxidation half reaction and a reduction half reaction.

 $\begin{array}{cccc} \operatorname{Ox} \# & +5 & +3 \\ & \operatorname{BiO_3}^- & \rightarrow & \operatorname{Bi}^{+3} \end{array} & (reduction half reaction) \\ \\ \operatorname{Ox} \# & +2 & +7 \\ & \operatorname{Mn}^{+2} & \rightarrow & \operatorname{MnO_4}^- \end{array} & (oxidation half reaction) \end{array}$ 

**Step 2: Balance the atoms undergoing a change in oxidation number** Balanced in this case

Step 3: Balance oxidation numbers using electrons

 $\begin{array}{rcl} \operatorname{Ox} \# & +5 & +3 \\ 2 \ e^{-} & + \ \operatorname{BiO}_{3^{-}} & \rightarrow & \operatorname{Bi}^{+3} \end{array}$  $\operatorname{Ox} \# & +2 & +7 \\ & \operatorname{Mn}^{+2} & \rightarrow & \operatorname{MnO}_{4^{-}} + 5 \ e^{-} \end{array}$ 

Step 4: Balance ACTUAL CHARGES using H<sup>+</sup> ions in acid solution or OH<sup>-</sup> ions in basic solution.

$$6 \text{ H}^{+} + 2 \text{ e}^{-} + \text{BiO}_{3}^{-} \rightarrow \text{Bi}^{+3}$$
$$\text{Mn}^{+2} \rightarrow \text{MnO}_{4}^{-} + 5 \text{ e}^{-} + 8 \text{ H}^{+}$$

**Step 5: Balance hydrogens using water** 

 $6 \text{ H}^{+} + 2 \text{ e}^{-} + \text{BiO}_{3}^{-} \rightarrow \text{Bi}^{+3} + 3 \text{ H}_{2}\text{O}$   $4 \text{ H}_{2}\text{O} + \text{Mn}^{+2} \rightarrow \text{MnO}_{4}^{-} + 5 \text{ e}^{-} + 8 \text{ H}^{+}$ 

Step 6: Check oxygen balance. If everything has been done correctly to this point, the oxygens will automatically balance!

Balanced !

Step 7: Recombine equations, multiplying as needed to eliminate the appearance of electrons on either side of the reaction.

Multiply bismuth equation by 5 and manganese equation by 2. Combining yields

$$30 \text{ H}^{+} + 8 \text{ H}_2\text{O} + 2 \text{ Mn}^{+2} + 5 \text{ BiO}_3^{-} \rightarrow 5 \text{ Bi}^{+3} + 15 \text{ H}_2\text{O} + 2 \text{ MnO}_4^{-} + 16 \text{ H}^{+}$$

or canceling excess hydrogen ions and waters...

 $\underline{14} \text{ H}^{+} + \underline{2} \text{ Mn}^{+2} + \underline{5} \text{ BiO}_{3}^{-} \rightarrow \underline{5} \text{ Bi}^{+3} + \underline{2} \text{ MnO}_{4}^{-} + \underline{7} \text{ H}_{2} O$
